

CalendarThis! App Summary

Repo-based overview (generated from source files)

What It Is

CalendarThis! is a Flutter app that extracts event details from text and creates calendar events across platforms. It uses AI via OpenRouter with a fallback to basic extraction.

Who It's For

People who receive event details in messages or emails and want fast, accurate calendar creation on their devices.

What It Does

- Extracts event details from pasted or shared text.
- Supports Android share/context menu intents to launch extraction.
- Lets users create and edit events manually when needed.
- Saves events locally and shows list or calendar views.
- Adds events to the device calendar with permission checks.
- Offers AI-based parsing via OpenRouter with a fallback basic mode.

How It Works

- Flutter UI in lib/views and lib/widgets; routes wired in main.dart.
- IntentService receives shared text via a platform channel and streams it to the UI.
- TextExtractionServiceImpl calls OpenRouterService (HTTP) to parse text into an ExtractionResult and EventModel.
- LocalEventService persists events to SQLite via sqflite and caches results with CacheService and CacheManager.
- CalendarIntegrationService uses add_2_calendar and permission_handler to open the device calendar.
- PreferencesService and LoggingService store settings and logs in SharedPreferences.

How To Run (Minimal)

- Install Flutter SDK 3.6.2+ and Dart SDK 3.0.0+.
- Run flutter pub get.
- Run flutter run with a device or emulator connected.
